

CS559: Computer Systems Lab

READ THE FOLLOWING INSTRUCTIONS CAREFULLY. FAILING TO ADHERE TO IT WILL LEAD TO DEDUCTION OF MARKS.

1. Make sure to give the correct information in your submission link. You will receive a response email for every submission. **You must save it for future reference for the whole semester as you will be asked to show it.**
2. Every assignment will have multiple questions. **For every question, you will save your solution (i.e. program) as a .c file.** So if “Assignment 01” has 4 questions (marked as 1, 2, 3 and 4), then you will save your solution program as 1.c, 2.c, 3.c and 4.c.

Note: Your program will be compiled to check if your solution is correct and you will be marked accordingly. If any solution file is missing or not submitted, the marks for that solution will be **zero**.

3. Submit your files in a compressed folder (rar or zip) as per “submission instructions” given in your assignment question paper.

Note: You must make sure to upload in .zip or .rar. **Folders submitted with any other extension or wrong extension will not be evaluated and awarded zero.**

4. The student must ensure that the submitted file is not corrupted and can be unzipped properly. **Corrupted files that cannot be opened will be given zero. Similarly bad filenames having any other extension than “.c” will not be evaluated and given zero.**
5. You will be able to upload your assignment multiple times within the deadline span, but only your last submission will be treated as final and considered for evaluation. **No plea/request to consider intermediate submissions for evaluation will be entertained.** So, make sure to carefully check that you are submitting the correct assignment.
6. The submission link will be automatically deactivated after the deadline, and no request/plea for extension will be accepted. **Non-submission /wrong submission will be automatically awarded zero.**
7. Your code will be checked for similarity and you will be penalized according to the following rule:

Similarity above 75%: 50% deduction

Similarity of 100%: full deduction

8. **Compiler Information: Program must be compiled using online gdb compiler. If your program can not be compiled using gdb compiler then marks will be reduced.**
Compiler Link : https://www.onlinegdb.com/online_c_compiler
9. **Marks for every assignment (other than practice assignments) will be mailed to you with remarks. You will be allowed a deadline for rebuttal, after which no rebuttal will be entertained.**

CS559: Computer Systems Lab

Date: [16th September, 2022]

Assignment [6]

Submission deadline: [23rd September, 2023 - 23:59 Hrs. IST]

Submission Instruction: Store your assignments in folder and compress it as a rar/zip file (filename should be in this format: `roll-number_assign(6).rar` or `roll-number_assign[6].zip`). For example, if your roll number is 2211CS01, store your assignment as 2211CS01_assign[6].rar or 2211CS01_assign[6].zip. Also, save each program in the format given beside each question. Upload the same at the below link:
<https://forms.gle/GRQ3aSHKXePgQ9Wd6>

1 Problem:1

In this lab, you will be given a set of processes with their arrival times and burst times. Your task is to implement the First-Come, First-Served (FCFS) scheduling algorithm to schedule these processes and calculate the Gantt chart, completion time (CT), turnaround time (TAT), waiting time (WT), average waiting time (AWT), and average turnaround time (ATAT). [10 points]

2 Instructions

1. Implement the FCFS scheduling algorithm in C/C++/Python. [save as `1.c/cpp/py`]
2. Read the input from the user. The input should include the number of processes, their arrival times, and burst times.
3. In case of tie-breaking (i.e., multiple processes arriving at the same time), you should use a tie-breaker based on process IDs (e.g., lower process ID gets priority).
4. Construct a Gantt chart to visualize the execution order of the processes.
5. Calculate the CT, TAT, and WT for each process.
6. Calculate the AWT and ATAT for the set of processes.
7. Print the Gantt chart, CT, TAT, WT, AWT, and ATAT as the output.

3 Sample Input

```
Number of processes: 6
Process   Arrival Time   Burst Time
P1        0           6
P2        2           4
P3        0           8
P4        4           5
P5        2           3
P6        0           7
```

4 Sample Output

```
Gantt Chart:
| P1 | P3 | P6 | P2 | P5 | P4 |
0    6   14  21  25  28  33
```

Process	CT	TAT	WT
P1	6	6	0
P2	25	23	19
P3	14	14	6
P4	33	29	24
P5	28	26	23

P6 | 21 | 21 | 14

Average Turnaround Time (ATAT): 19.83

Average Waiting Time (AWT): 14.33

Throughput: 0.182

Date: [16th September,2022]

Assignment [6]

Submission deadline: [23rd September, 2023 - 23:59 Hrs. IST]

Problem [1]:

- Improper indentation: -1 points
- Compilation error: -1 points
- Input not taken(i.e hard-coded): -2 points
- Wrong logic/output: -6 points
 - Wrong Gantt Chart: -2
 - Wrong Avg TAT: -1.5
 - Wrong Avg WT: -1.5
 - Wrong Throughput: -1
